

Jeremy Kamber

Seattle, WA | kamberj@uw.edu | 973-879-5350 | jeremykamber.com | github.com/jeremykamber

Programming Languages:	TypeScript/JavaScript (ES6+), SQL, Java, HTML/CSS, Python, Dart, R
Frameworks & Libraries:	React, Next.js, Node.JS, FastAPI, Playwright, LangChain, Flutter, scikit-learn
Tools & Platforms:	Docker, Git/GitHub, PostgreSQL, Google Analytics (GA4), n8n, Linux/Ubuntu

EDUCATION

Bachelor of Science in Informatics (GPA: 3.96) University of Washington (UW) - Seattle	June 2028
<i>Software Development, Human-Computer Interaction</i>	

RELEVANT EXPERIENCE

Founder & Lead Engineer Bringforth Studio (AI Product Lab) Remote	Apr. 2025 – Present
- Built and deployed an automated outbound platform using self-hosted AI workflows (via n8n), reducing manual prospecting effort by more than 70%. - Led customer discovery to define target customer profiles, then designed and deployed internal backend services using FastAPI, Docker, and Ubuntu-based infrastructure. - Owned product architecture, backend systems (using Python and Uvicorn), deployment, and technical direction across internal AI products.	
Director & Organizer iStartup Launch Sprint (UW iStartup Lab) Seattle, WA	Mar. 2026 – Present
- Co-founded and operated a two-week startup accelerator serving 26 student founders, managing program operations, execution timelines, mentor coordination, and stakeholder communication. - Designed curriculum and advised students on customer discovery, MVP development, and go-to-market strategy while recruiting founders, mentors, and venture judges across the UW startup ecosystem. - Designed and delivered a workshop on AI-assisted software engineering, teaching practical workflows for architecting and building software with coding agents; attendee demand led to a separate recorded version.	
Teaching Assistant (INFO 442 - Cooperative Software Development) University of Washington - Seattle	Mar. 2026 – June 2026
- Pioneered the course's first AI engineering resource library and led the curriculum shift toward agentic development, introducing students to frameworks for prompt engineering, agent harnesses, and AI-assisted persona creation. - Selected by faculty to support software engineering instruction through grading, lab sections, and technical mentorship for over 30 students.	

PROJECTS

Kynd (Synthetic Persona User Testing Platform)	Jan. 2026 – Present
- Built and deployed a platform that transforms customer interviews into synthetic personas to perform artifact analyses and product research. - Reorganized a monolithic 1,200+ line LLM service into modular domain-specific services, then introduced provider abstractions to support multiple LLM APIs (OpenAI, OpenRouter, Ollama, etc.) without changing business logic. - Implemented a RAG pipeline to ground synthetic personas in generated life narratives, improving contextual consistency during long-running chats or analyses. - Deployed production infrastructure supporting asynchronous AI workflows (via Node.JS), and a containerized Playwright browser service (via Docker).	
Koda (Voice-to-Voice for Coding Agents)	Feb. 2026 – Present
- Drove PR-based development across a shared repository, including branching, code review, and CI-enforced merges. - Advised team members on improving their agentic coding workflows (explicit plan review, adversarial interrogation, subagents) that improved code quality, developer understanding, and productivity. - Engineered a Docker runtime layer to create and manage containerized environments for integrated coding agents; exposes wrapper API to communicate with agents via ACP (Agent Context Protocol).	
Strata (Agentic Memory System)	May 2026 – Present
Built a CLI-based Python that engineers context passed to AI agents, separates context using LRU-inspired lifecycle algorithms into active, long-term, and archival storage.	
Echo (Local-first AI Journaling App)	Jan. 2025 – Nov. 2025
- Built a local-first AI journaling application (using OpenAI API, LangChain, Ollama) that reached 100+ users and generated its first paying customer. - Designed the React frontend, PostgreSQL data model, and Supabase backend supporting user feedback collection and retrieval.
